

Experimental Data Analysis: Jaffe dataset

We plotted random images (7 from each dataset), following the same procedure as in the EDA of CK+ and FER. Here, we use 3 frames per person. The images are all in tiff format (tiff is that) and are provided in grayscale format.

All images are 256 x 256 pixels. We have 10 participants, all women.

Summary:

All images are 256x256, which is a major difference from the CK+ dataset and the FER dataset. There is a nice balance throughout datasets, but a gender bias 100-none female/male. Also we can't plot more than 10 images.
